#### WHAT IS PANDAS?

- Pandas is an open source data analysis library written in python
- It leverages the power and speed of numpy to make data analysis and preprocessing easy for data scientists
- It provides rich and highly robust data operations

#### PANDAS DATA STRUCTURE?

#### Pandas has two types of data structures:

- Series It's a one dimensional array with indexes, it stores a single column or row of data in a Dataframe
- Dataframe It's a tabular spreadsheet like structure representing rows each of which contains one or multiple columns
- A one-dimensional array (labeled) capable of holding any type of data- Series
- A two-dimensional data (labeled) structure with columns of potentially different types of data DataFrame

# **Import Library**

```
In [1]: import pandas as pd # import library pandas
```

# Types of Reading Csv and Excel files in Pandas

```
In [2]: df = pd.read_csv("Diabetes.csv") #It will work if csv file in same folder
```

#### Reading files through other folder

In [5]: df1 = pd.read\_excel("C:/Users/prata/Downloads/restaurant.xlsx")#First we have convert Backward slash (\) into forward slash

### To Cheek First and last Rows from DataSet
